

Nekton

Although humans swim in the ocean we are not of the Nekton family. Nekton is the name given to all those animals that swim actively at various levels in the sea. These animals include fishes, squids, whales and many varieties of crustaceans such as prawns. Many animals belong to the Nekton group only during their adult life, in their younger stages they drift at the surface with the plankton.

For this project you will need poster size, blank paper. Divide your paper in half by drawing a line in the middle. The top half is the sky and the bottom half is the ocean. Section parts in the sky and write what you could find in those areas. Do the same with the ocean section. Write the different depth levels of the various species found in the ocean.

You can glue or draw pictures of the different animals in each section to make your poster more effective and attractive.

Sky section

Stars

Eagles

Smaller birds

Insects
